GRIDRESCUE AI

Business Model Canvas

Decision-support software for hospitals on weak grids | hospitals first | vendor-neutral

SITE > SIMULATE > FINANCE

Decision-support software | No hardware sales

Secure AI Grid · Pavan Manjunath · Thomas Prüfer

CAPITAL REQUEST	TARGET RELEASE	PILOT MILESTONE	PROPOSED PRICE
US$ 150,000 software only two tranches	**9–12 mo** commercial release	**2 paid sites** by month 9	**US$ 2,000** assessment + US$ 3,000/site/yr

8 KEY PARTNERS

- Hospitals and health authorities
- ESCOs and energy-system integrators
- Utilities and distribution companies
- Open-data providers (incl. the OpenStreetMap / MapYourGrid community)
- Financial institutions and DFIs

7 KEY ACTIVITIES

- Simulation development and validation against measured data
- Software maintenance and security
- Customer onboarding
- Reporting

6 KEY RESOURCES

- Simulation engine and software IP
- Open-data pipelines (NASA POWER, PVGIS, PVWatts, Global Solar Atlas, OpenStreetMap, published tariffs)
- Energy-engineering expertise
- Cloud
- Partner network

2 VALUE PROPOSITION

- **One workflow from a map pin to an investment-ready plan: site read from open data → hour-by-hour outage simulation → vendor-neutral solar + backup energy system + generator design → cost, payback and ESG report**
- Relocatable designs
- Minutes instead of weeks
- Transparent assumptions, no hardware sales

4 CUSTOMER RELATIONSHIPS

- Guided pilot assessment
- Annual licence with support and periodic recalculation
- Implementation-partner coordination

3 CHANNELS

- Direct institutional sales
- ESCO and integrator partners (white-label)
- Health networks and development programmes
- The free grid mapper as the front door

1 CUSTOMER SEGMENTS

- Hospitals and clinics on weak grids (first: federal and teaching hospitals, Nigeria)
- Healthcare networks and health programmes
- ESCOs, energy-system integrators, hospital energy contractors
- Utilities (feeder planning)
- Later: data centres, water, telecom, industrial and agricultural sites

9 COST STRUCTURE

- Development and productionisation
- Model validation
- Security and testing
- Cloud and data
- Pilot integration
- Customer acquisition
- Legal and IP
- Compliance

5 REVENUE STREAMS

- Paid site assessment (US$ 2,000 per site, proposed)
- Annual software licence (US$ 3,000 per site, proposed)
- Enterprise multi-site and utility licences
- Integration / white-label fees
- Later: performance-based fee after verified savings

Proposed model: prices and targets require customer validation; no customer commitments asserted. No live grid control or equipment sales. Page 2 shows the investment case.

INVESTMENT CASE | ILLUSTRATIVE, NOT A FORECAST

Hospital ROI · software revenue · use of funds · investor repayment

THREE MONEY STORIES
hospital · ESCO · software, never mixed
Secure AI Grid

FUNDING ASK	RELEASE TARGET	NEW CUSTOMERS Y1	YEAR-4 REVENUE
US$ 150K two tranches of US$ 75K	**9–12 mo** commercial release	**10 sites** planning target	**US$ 370K** scenario, before operating costs

(a) Hospital ROI — National Orthopaedic Hospital, Enugu

ENGINE · MODELLED ±30 %

The hospital's own money story (worked example). Not GridRescue AI revenue.

Investment capex **₦3.85 bn** + year-5 move **₦678 M** (88 % reused)

Bought outright diesel savings alone repay it in **1.6 years** (including the move)

10 years **₦37.6 bn → ₦15.9 bn** **₦21.8 bn saved**
all energy costs of the protected load: grid 6 h + modelled diesel → fee + remaining diesel + remaining grid

ESCO route **₦0** upfront · **₦69.1 M**/month fee vs **₦299.2 M**/month of modelled diesel
the fee is the hospital's cost, paid to an ESCO — not GridRescue AI revenue · break-even bill ₦117.9 M/month

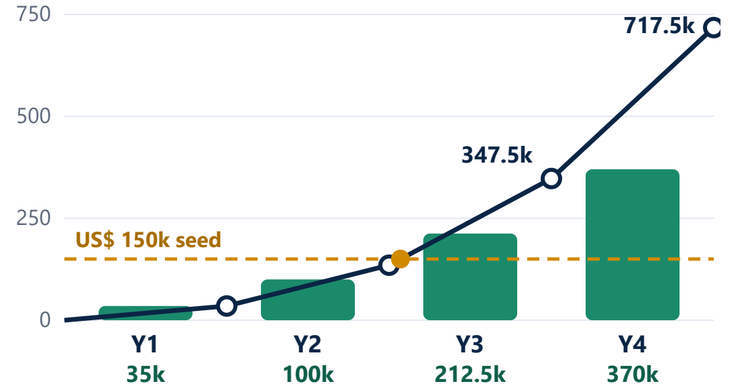

CO_2 **2,246 t** a year avoided, net (2,323 t Scope 1 − 77 t Scope 2)

Diesel ₦3,277/L (NBS, national average) · grid ₦160/kWh (EERC Band A) · to be confirmed with the hospital's load data.

(b) GridRescue AI software revenue scenario, Y1–Y4

ILLUSTRATIVE

US$ · new sites × 2,000 + average sites × 3,000 · site targets from the team's planning model

	Y1	Y2	Y3	Y4
Sites, end	10	30	65	115
New	10	20	35	50
Average	5	20	47.5	90
Revenue	**35k**	**100k**	**212.5k**	**370k**
Cumulative	35k	135k	347.5k	717.5k

Revenue in the year · Cumulative · US$ 150k seed · passed in Y3

Passes the US$ 150k seed during Y3 — **before operating costs** (to be validated); revenue, not profit.

(c) Use of funds — US$ 150,000

PLANNING ESTIMATE

Funds the software business — not hospital hardware (that needs separate project financing)

- Software engineering **US$ 70k**
- Energy engineering & validation **US$ 20k**
- Pilot integration & field validation **US$ 15k**
- Security, testing & hardening **US$ 12k**
- Customer acquisition & partners **US$ 10k**
- Cloud, weather & geospatial data **US$ 8k**
- Legal, contracts & IP **US$ 5k**
- Contingency **US$ 10k**

Tranche 1 · US$ 75k at the start: engine validation with the hospital's load audit and generator logs; security hardening

Tranche 2 · US$ 75k after the simulation engine passes agreed validation tests against hospital data and a pilot partner is secured

(d) How an investor is repaid

Stated plainly — nothing here is computed or promised

Equity return depends on operating costs and a liquidity event — not computed. No exit value, valuation, dilution or discount rate is assumed; operating costs are still to be validated.

The milestones de-risk tranche 2: the second US$ 75k is released only after the engine passes agreed validation tests against hospital data and a pilot partner is secured. Lean pilot option: US$ 75k, about 6 months.

Targets (planning, not achievements): release in 9–12 months · 2 paid pilots by month 9 · 10 paying sites by month 12.

Hospital savings (a) are not investor returns: GridRescue AI earns software fees only.

Sources: engine results of the running application (modelled, ±30 %) · NBS Automotive Gas Oil price watch (national average) · EERC Band A tariff · site targets from the team's planning model · prices proposed, require market validation.
